

MICROPROFILE WITH HELIDON

dhananjayan

Breaks

- 11.30 – 11.50
- 1 – 2
- 3.40 – 4.00

Pre-requisite

- Name, Role and Objective
- Working Knowledge of Java EE
- REST / Services Architecture - Developing /Deploying /Debugging
- Monitoring Tools – Awareness
- Awareness to Cloud Computing
- Awareness to Container Architecture

View – Agile Projects

Upstream → Integration

Big Picture - Leverage

Define Contract for Service,
Parameters

Down stream

Implement the service capability

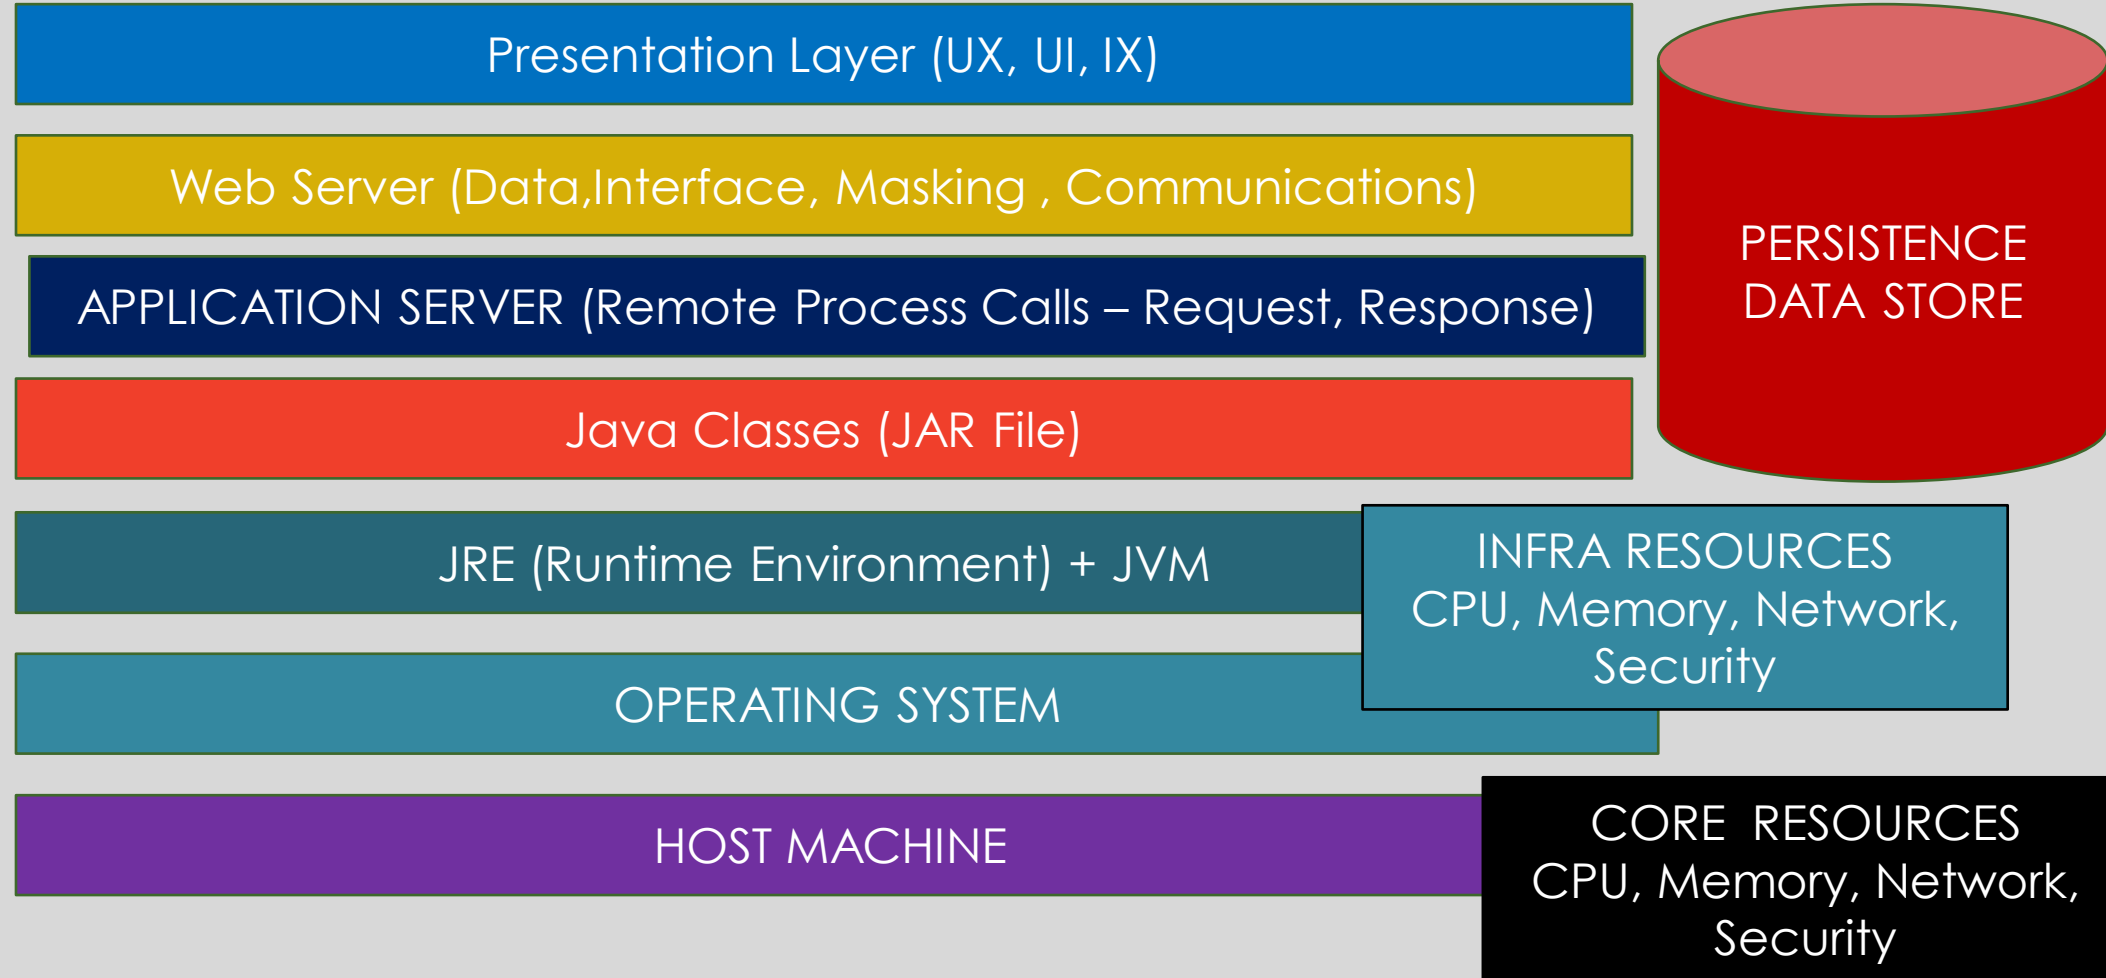

Developing capability

Architectural Styles

- Data Centered Architecture
- Data Flow Architecture
- Call and Return Architecture (changes)
- Object Oriented Architecture
- Layered Architecture (n-tier)
- Event Driven Architecture (EMA)
- Monolithic (Legacy)
- **Microservices Architecture**

Applications

Tightly Coupled
Separation of Concerns
Change – Code goes to ICU ?

Cloud Application

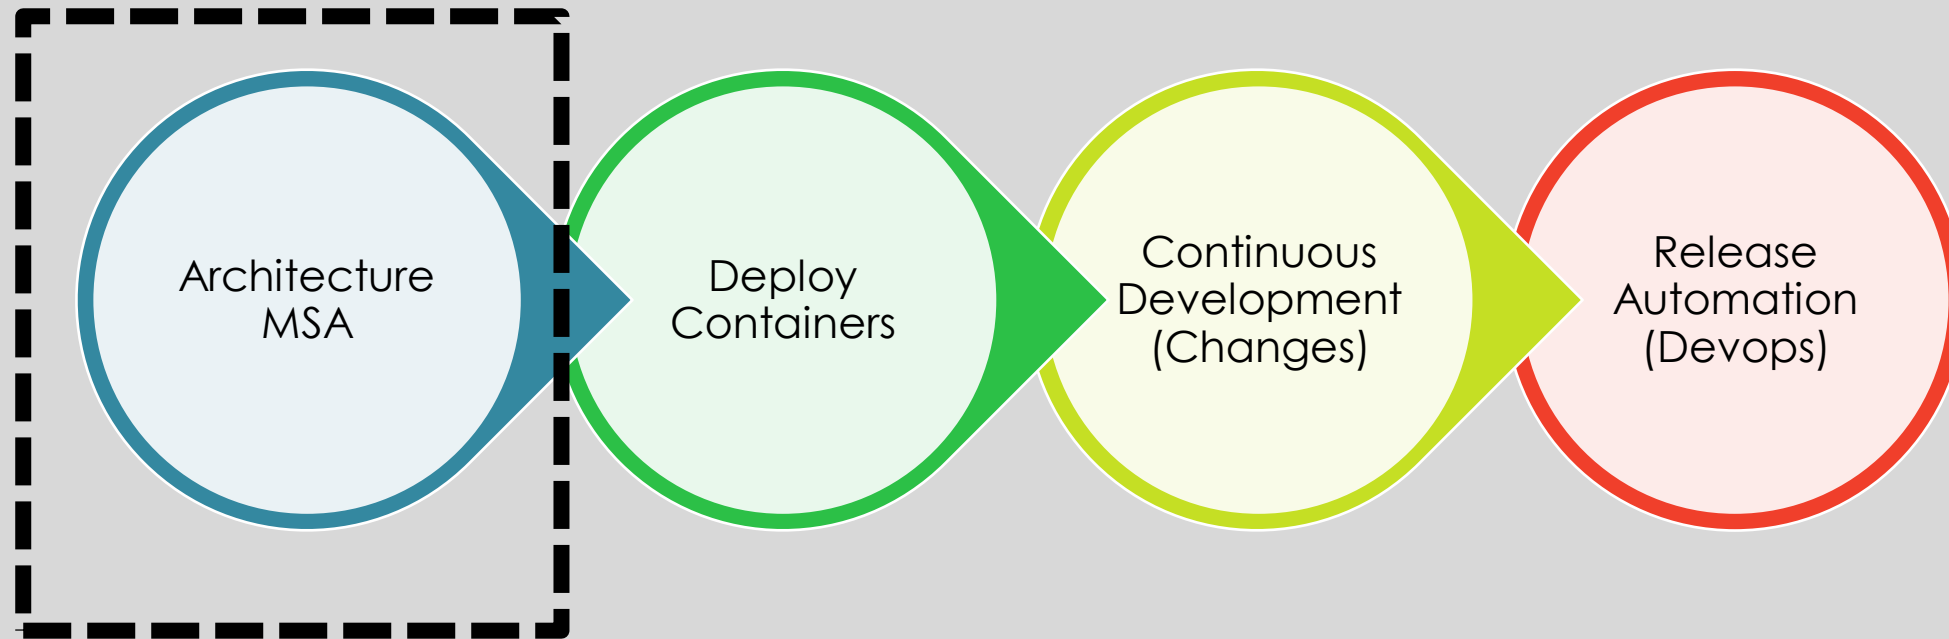

Highly Available (Capabilities) / (Infrastructure)

Adapt to changes Frequently – Uptime (Available)

Optimize the cost of Infrastructure – No Big Bang Approach, Pay per Usage

NO-Compromise on Performance (Application) & Security

Cloud Native Applications

Evolution

App Delivery	App Design	App Deploy	App Host or Integrate
All in one Release Minimize Release Maximise Features	Tightly coupled (Monolithic)	Host Machine (BareMetal Server Boxes)	Farm – Data Center
<u>Boxed</u> Releases Incremental Release More Releases, Less Features (Agile in Dev/QA)	Layered Architecture Persistent DB Interconnected Service Services are Independent	Virtual Machines (Workloads) Tightly coupled	On -Premises
Agile in Dev and Ops (Devops) Constant Evolution	Loosely Coupled – Independent Service (Microservice Architecture)	Develop once Deploy Anywhere Container (Independent processes)	Cloud Infrastructure

Cloud Native Application Consideration

- Portability (Develop Once Deploy anywhere)
- Define the scope of Independence (Slide 11)
- Capability Change (Code change) is only change
- Faster Changes (Move Faster, Market Faster) and Automate Fast changes
- Automation changement – Release management processes

Logical Meaning of Microservices

1

Independent by Definition (JAR,WAR or TAR)

2

Independent by Deployment (Containers or VM or Host Machines)

3

Independent by Scale (Replicate – Multiple Copies – No SPOF*)

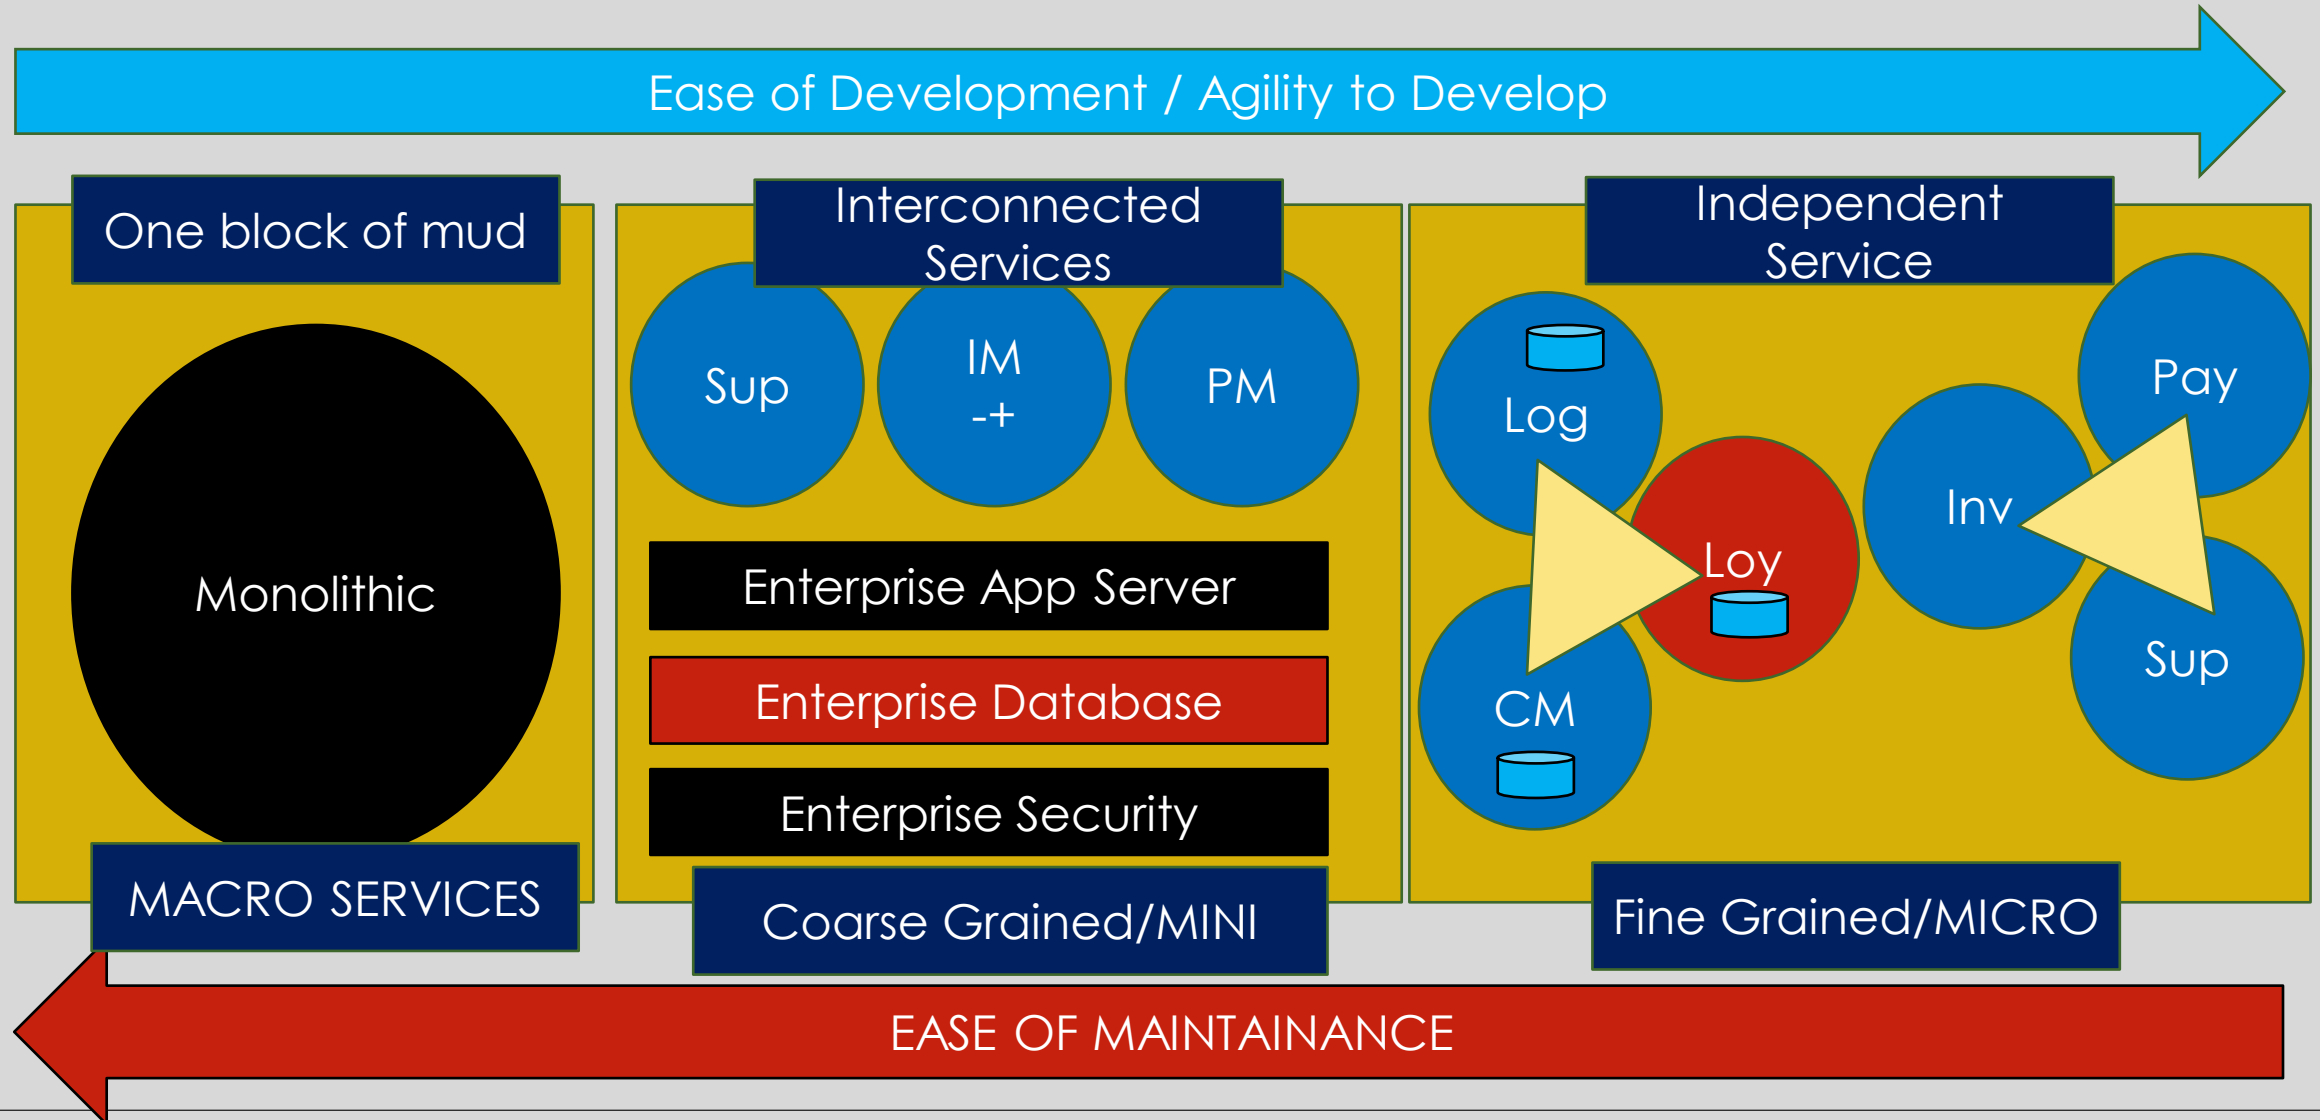

4

Independent by Test (Test the Individual Capability – Health, Trace and Verify)

5

Independent by Data (Data Structure is away from RDBMS)

Fine Grained Applications..

CNCF

- Open Source Framework
- Fine grained Architecture
- Dynamic Orchestration
- Dynamic Resource management
- In house / off –the-rack
- Integrator IT , Ops and Services

Cloud Native Application Principles

- (1) **Loosely Coupled**
 - Suite of Services (I/O)
 - Runs on it own process (container in real time)
 - Communicate through Light weight – http
 - Built for Business capability
 - Independently Deployable
 - Supported by Automation

CN Principles...

- (2) **Multiple Frameworks – Develop and Breed**
 - Multi Framework Development
 - Polygot (Multiple Datastructures)
 - Common runtime across selective platforms (native runtime) like graalVM
 - ML Data Science (Analytics across streams) – Python
 - REST API (Java for Rest API) – Spring Boot , Java EE
 - WebSocket programming - node JS

CN Principles..

- **Centered Around API**

- Interaction
- Collaboration (Communicate)
- Use Light weight API – Http
 - REST API (Security, Header, Context, Session)
 - Binary Protocols (gRPC, Protocol Buffers) - Internal Servers
 - MQ/APMQ (Messaging , 1-#)
 - Stateless Applications

CN Principles ..

- **Resilience**

- Not to Avoid , Respond or Repair or Recupperate
- Strategies
- Ability to run

- **Continuously monitor**

- Take action on Failure
- Agile
- Elastic

Migration Transformation

Solution Patterns

(*applicable for all design styles...)

Generating	Structural	Behavioural	Data Driven	Enterprise
+ Singleton + Factory + Clone + Prototype	+ Adapter + Façade + Decorator + Proxy + Bridge	+ Observer + Visitor + Mediator + Pub Sub + Iterator	+ Lazy Loading + CQRS + 2 PC + Shared DB	+ Container Architecture + Paging Models / Streams or Cache

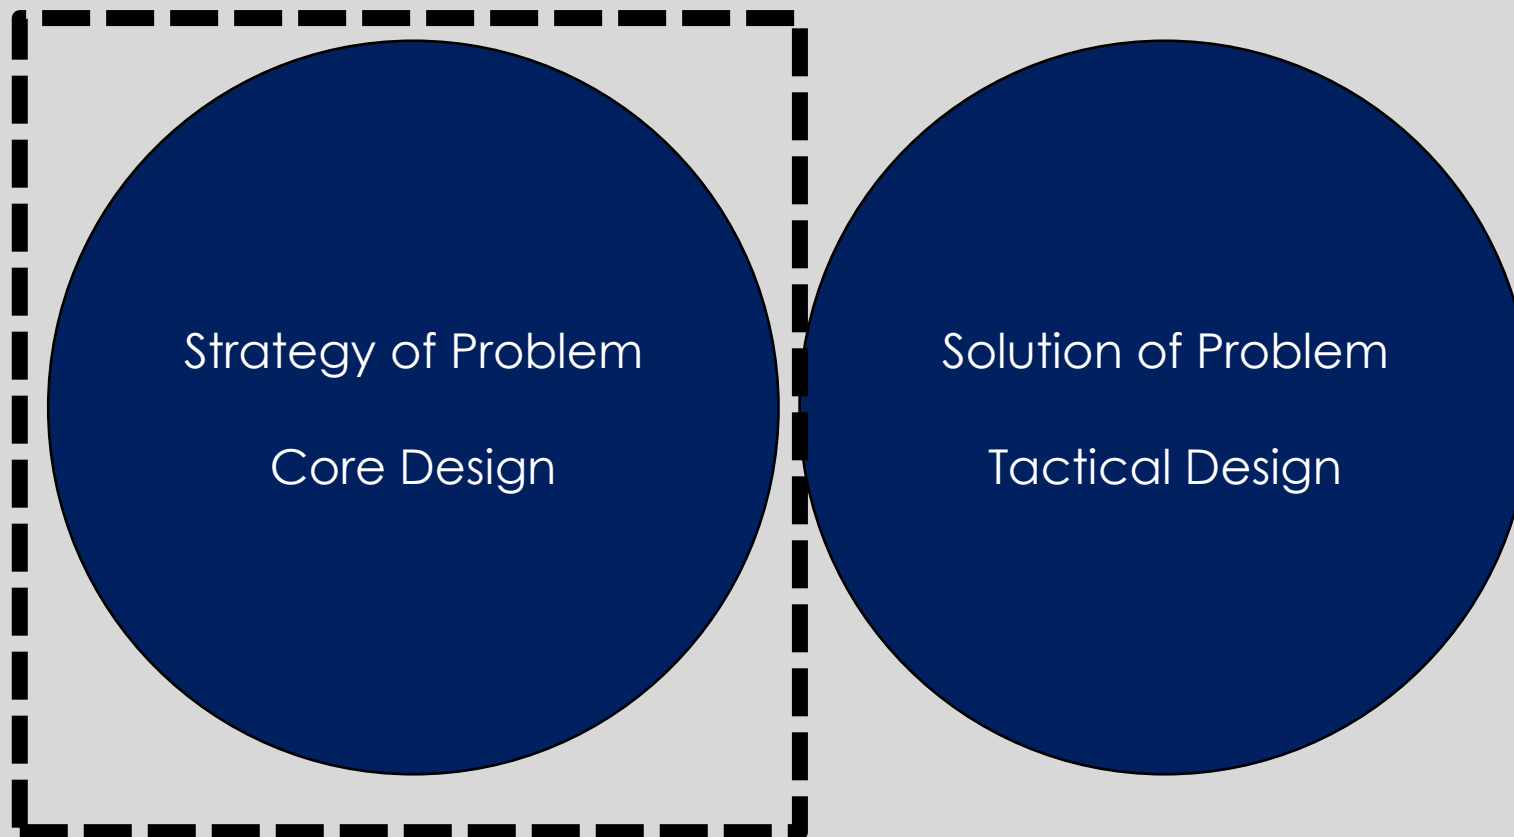

Yield Microservices

Domain Driven Design

- Aid the journey in Microservices
 - Focus on the Solution not the Technology (**ubiquitous Language**)
 - Focus on Business Capabilities (Problem)
 - When not to divide, when to divide
 - Dependency Services (Strongly Coupled) – Attached Services
 - Independent Services (Loosely Coupled)

Domain Driven Design

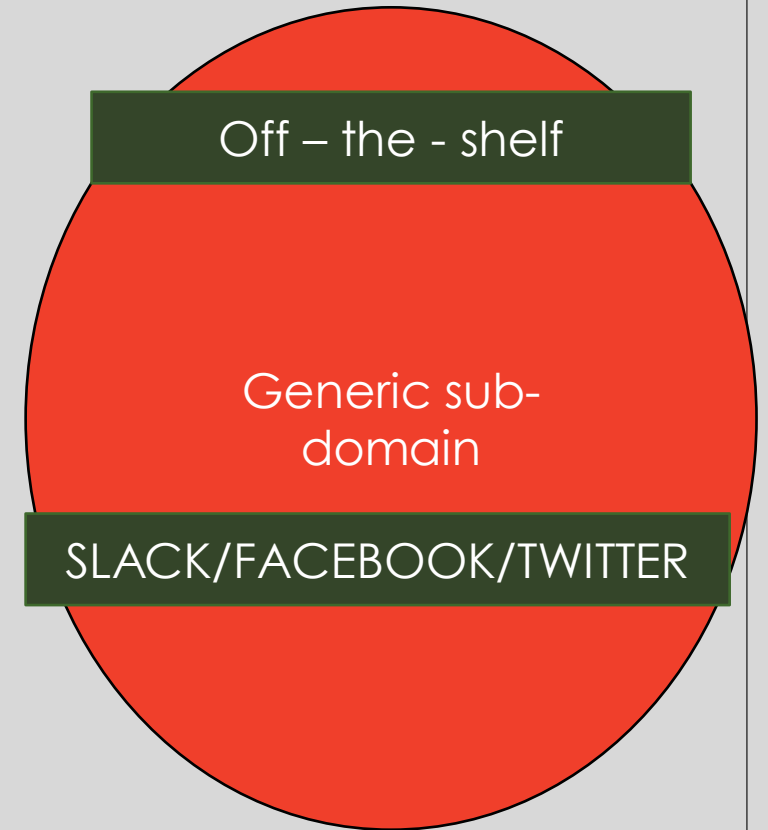

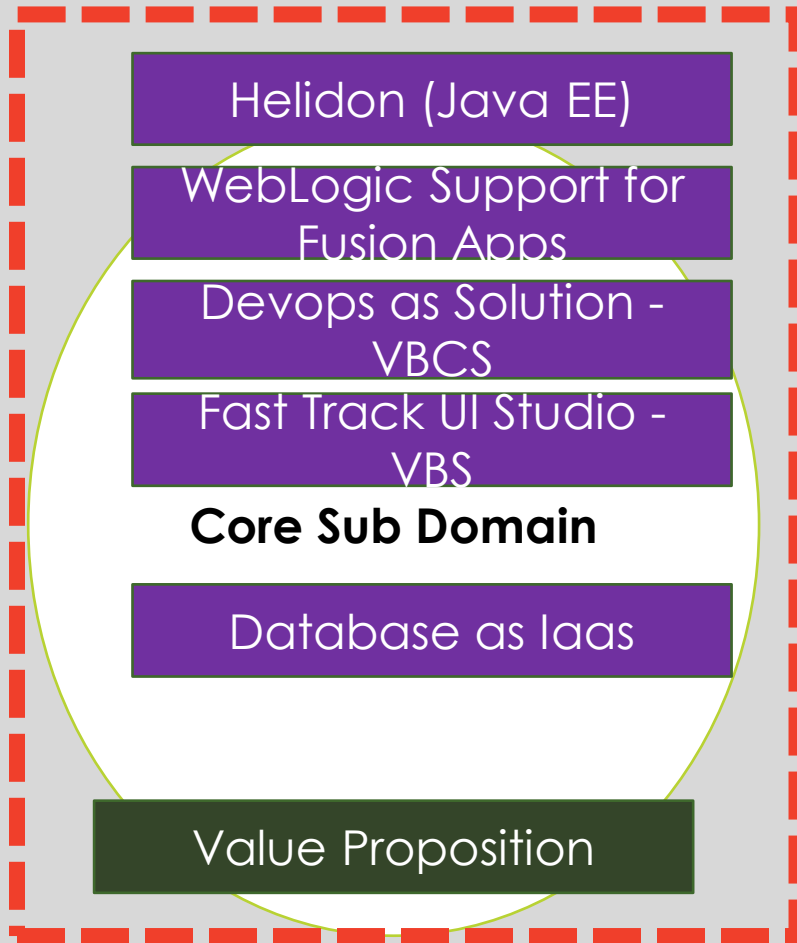

Strategy of the Problem

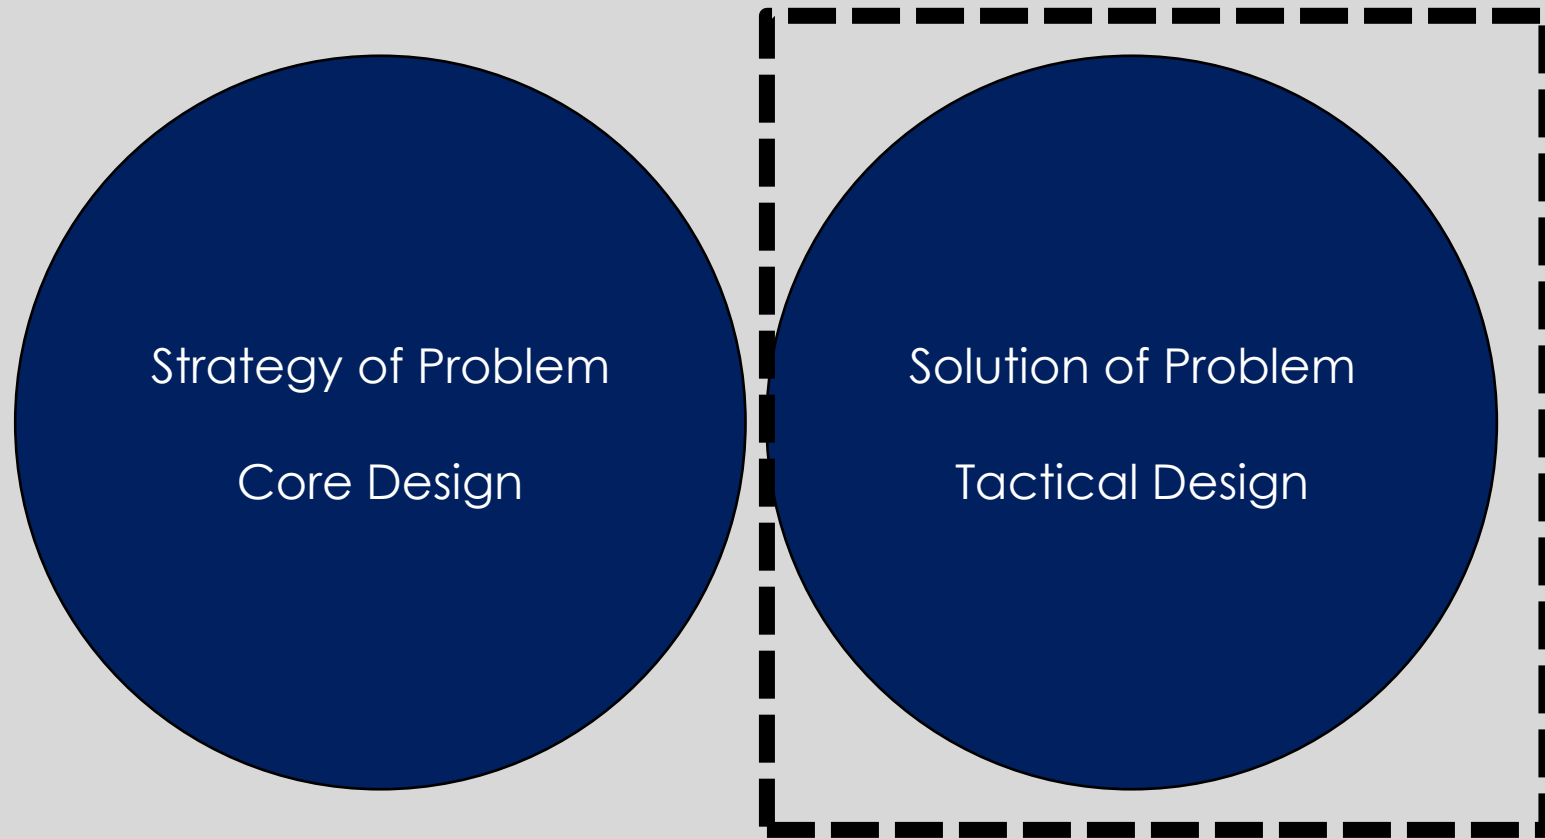

What to Solve ?

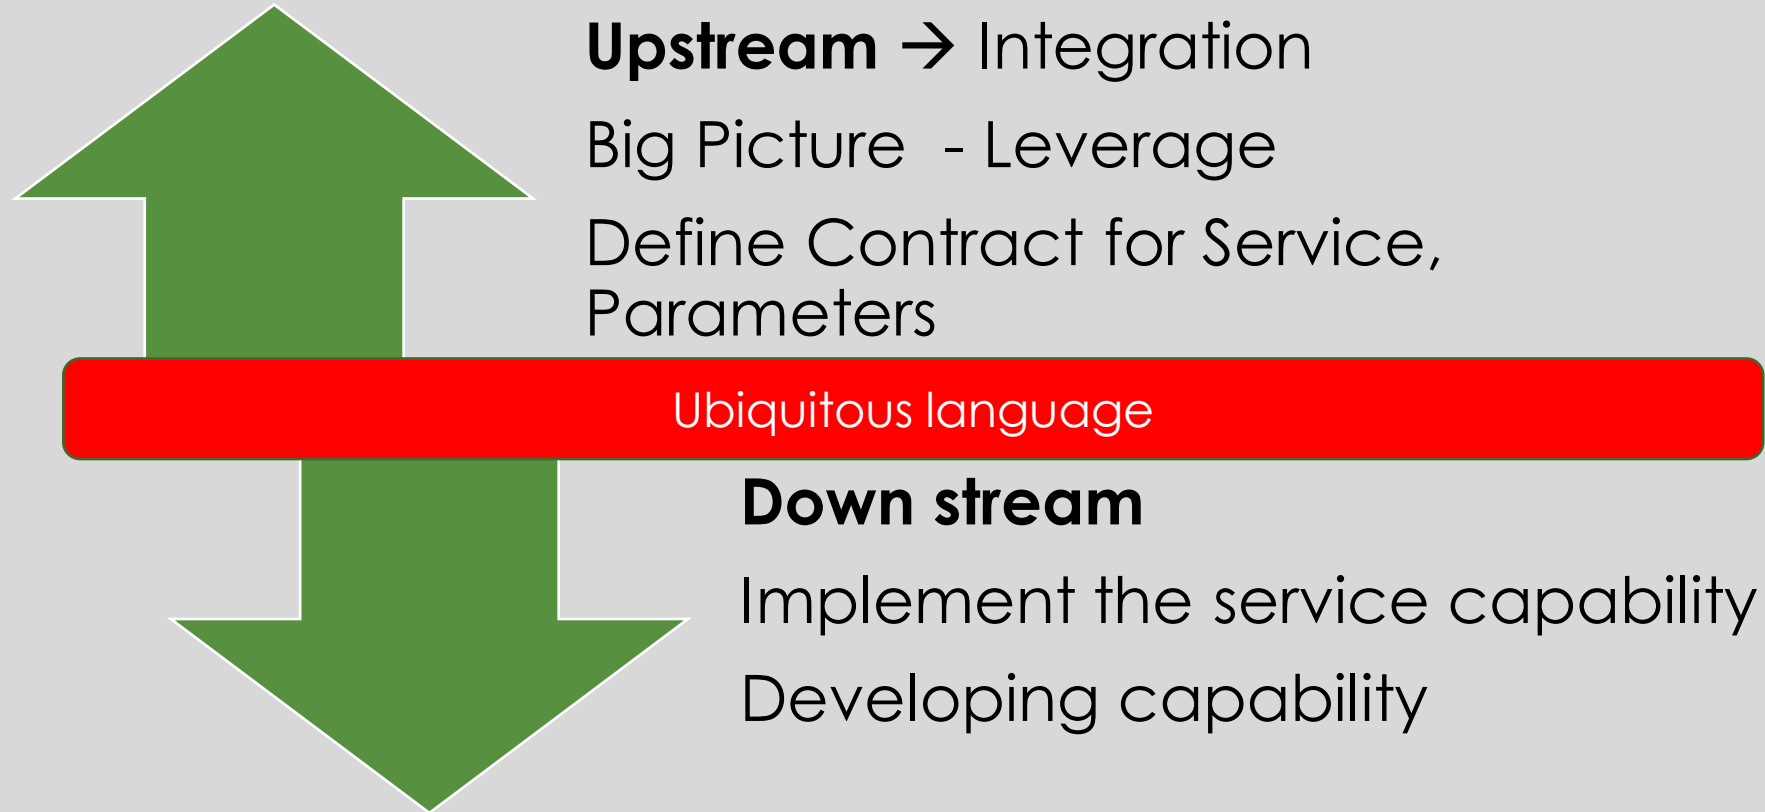

Oracle Cloud Infrastructure (Dev) ?

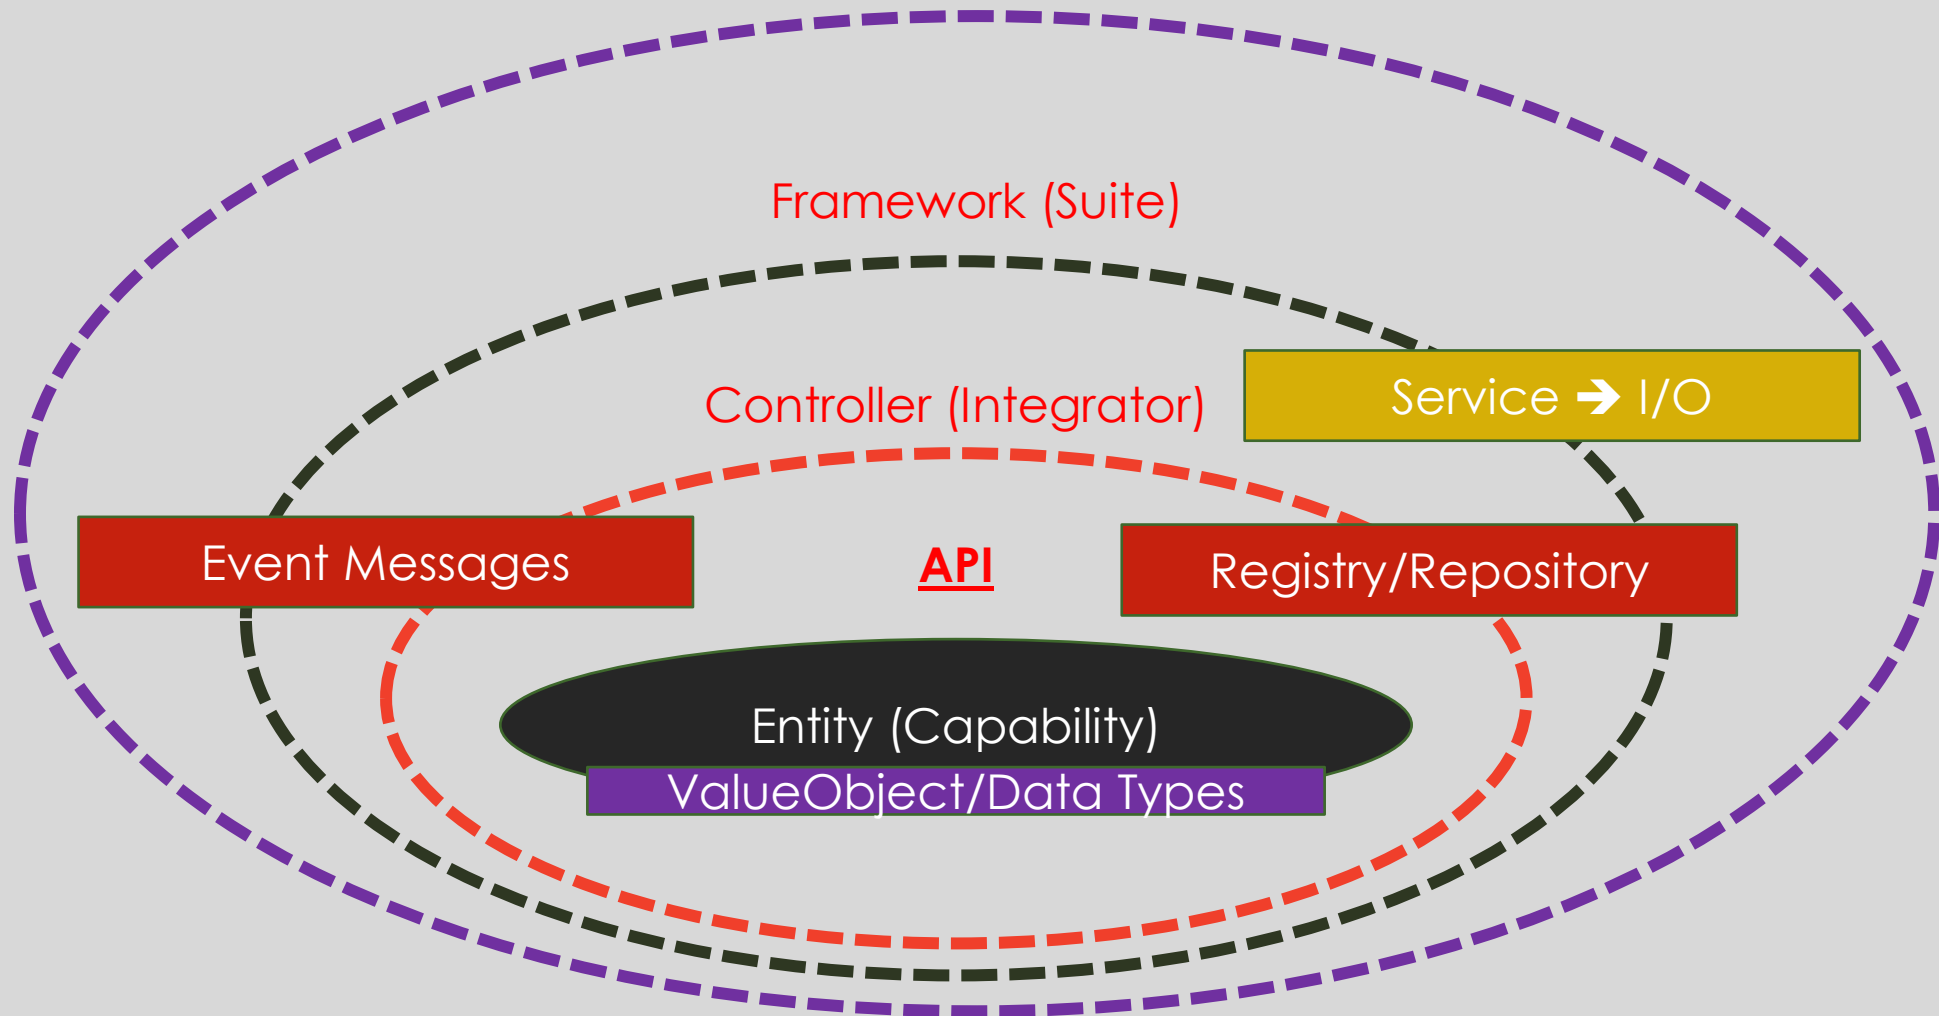

Domain Driven Design

View – Agile Projects

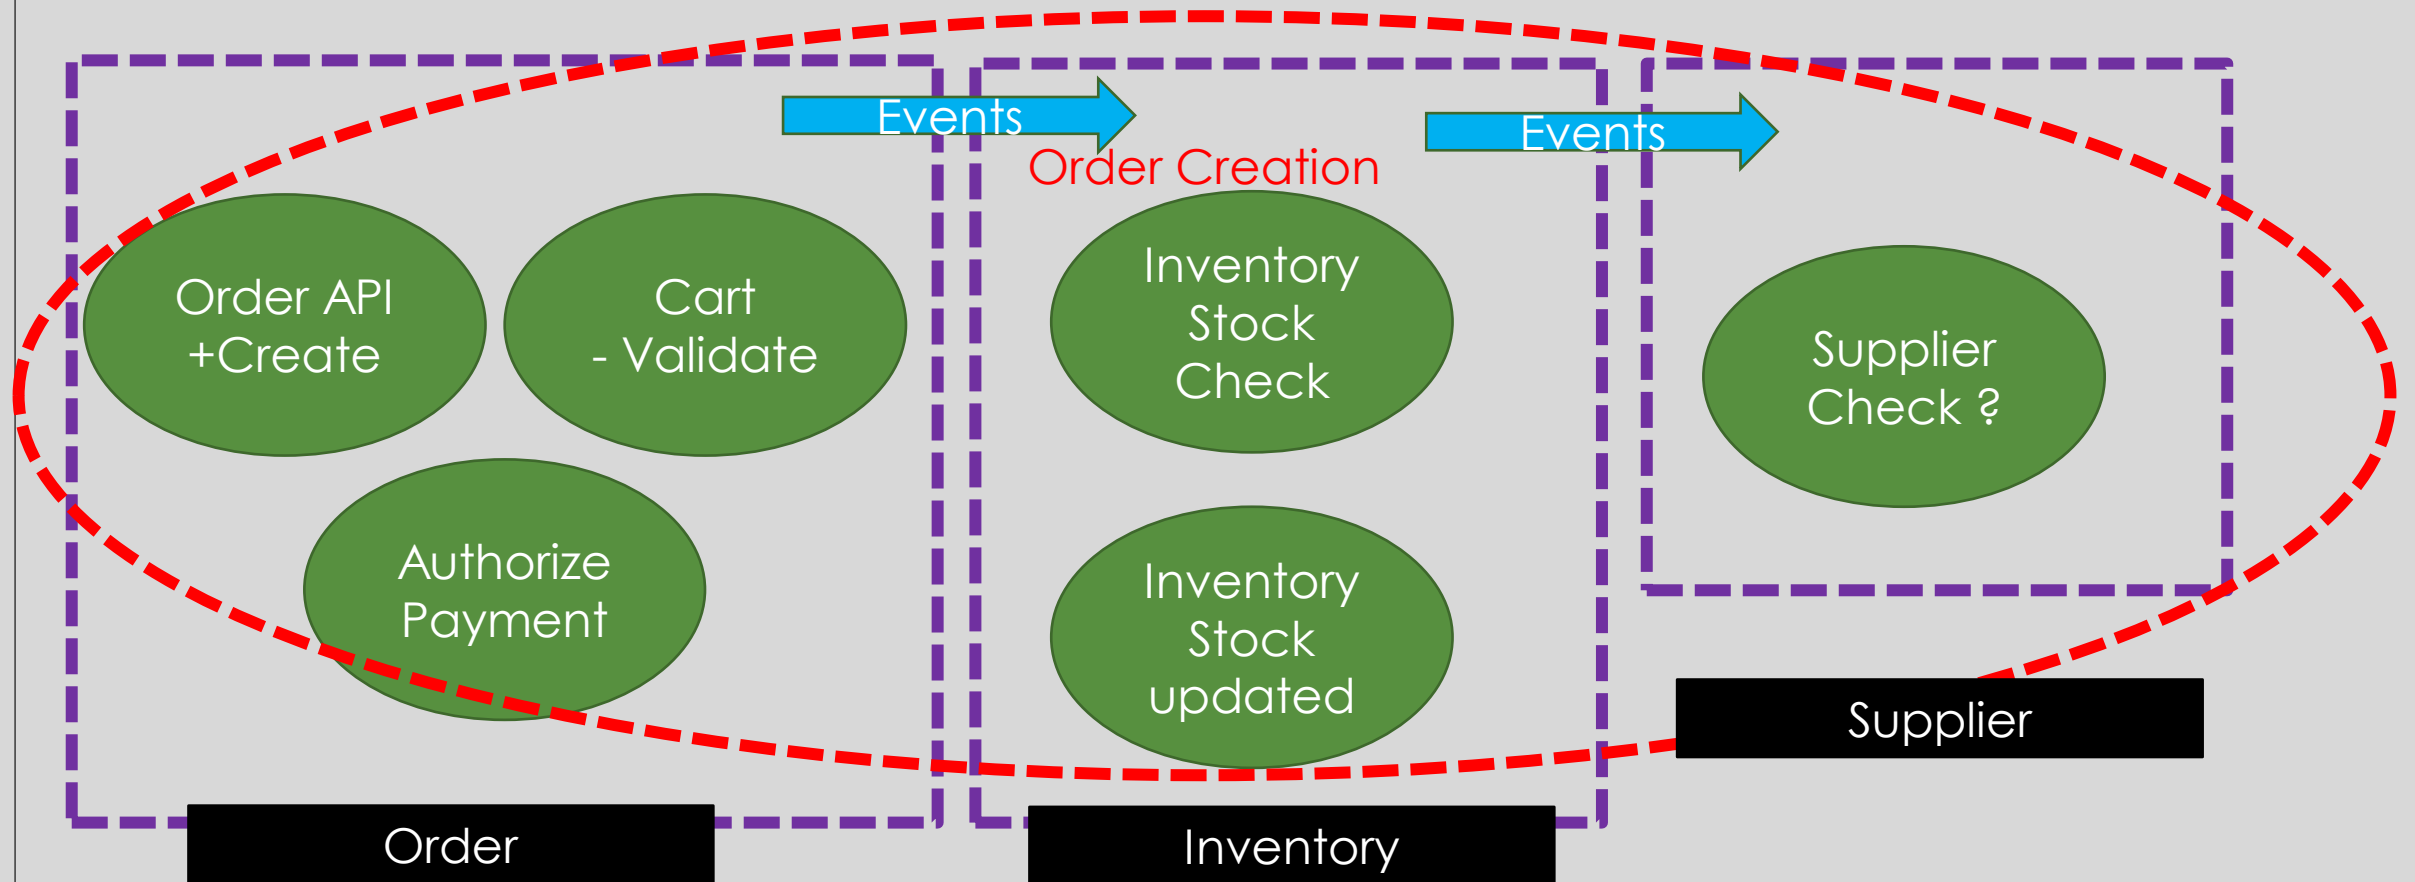

Tactical Part of Problem

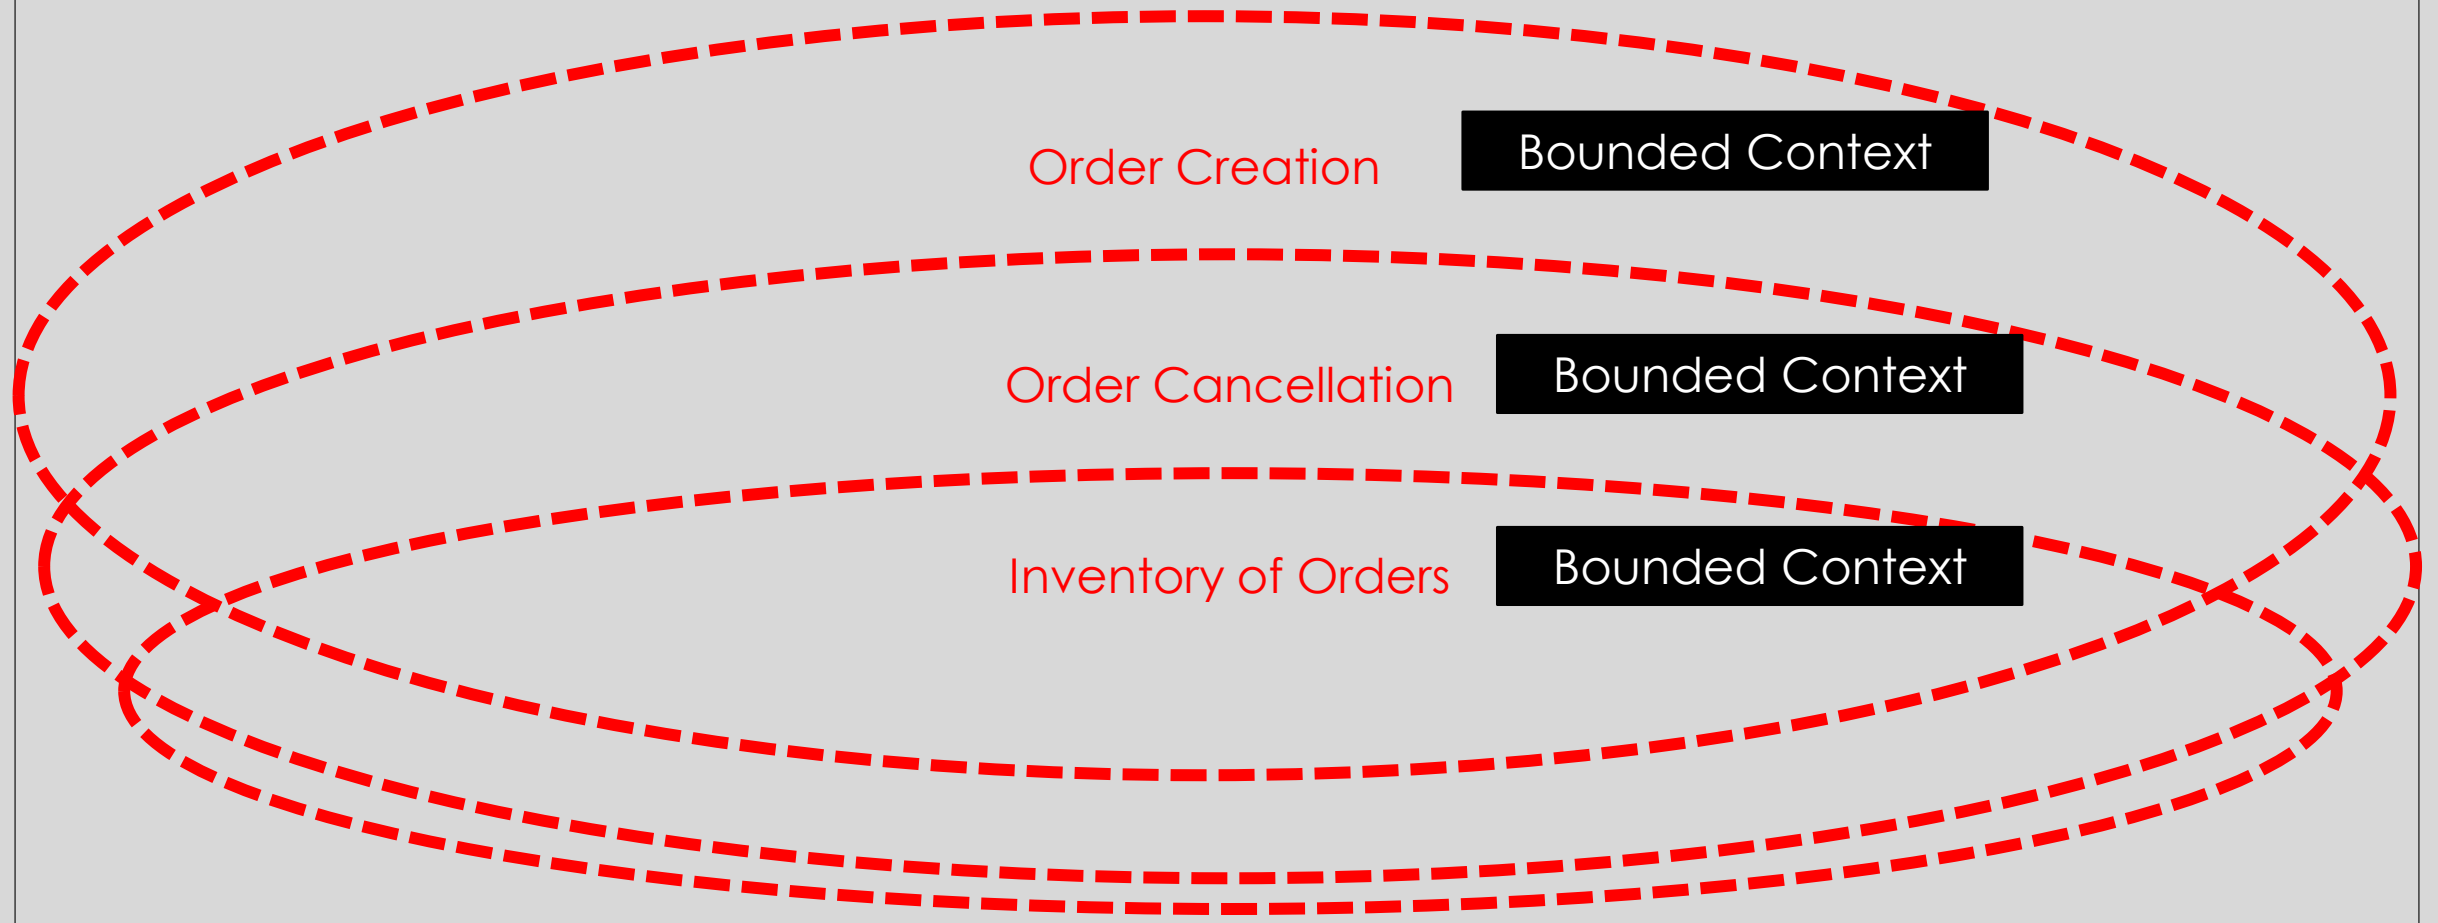

Bounded Context

Entities in a common solution delivers a functionality

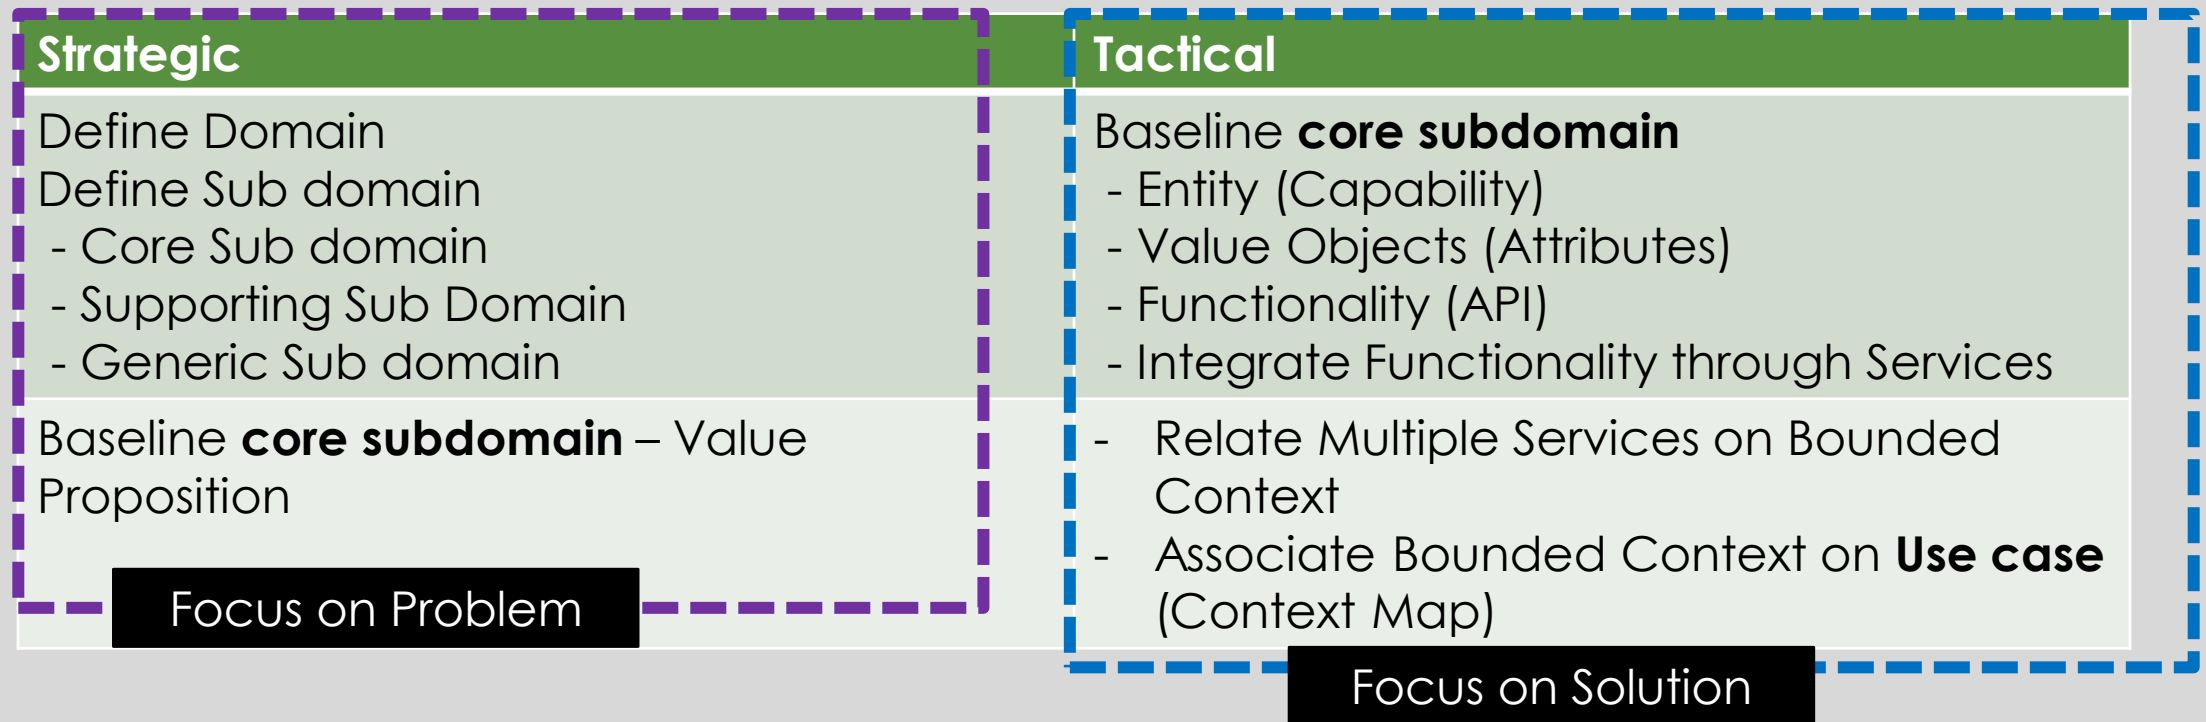

Order Creation (use case)

Context Map → Related Bounded Context

DDD for Microservices

Infrastructure setup pre-requisite

For users with Maven

In ~/.m2
(Rename this
directory)

Install JDK

Java JDK
16

SET JAVA_HOME

Install Maven

Maven
3.6+

#mvn --version

Productivity Tools

Windows – GITBASH
Mac - Terminal

IDE – Eclipse IDE

Provisioning from Development...

Scheduling /Orchestration	Runtime
Service Communication Service Gateway /API Gateway Service Proxy Service Mesh	Where is your Mount point (what data) Container Network Security/Keys/Values/Vault Automation and Configuration

12 –app factors for **microservices**

Project Properties

- Code to manage versions - Code Base (SCM Tools – GitHub, Bit Bucket) VSTS - versioning
- Declare all your dependencies (isolate your dependencies) – Maven or Gradle
- Configuration of Parameters or Resources (Isolate Configure Resources) (Env Variables)

12 –app factors (2)

Run Properties

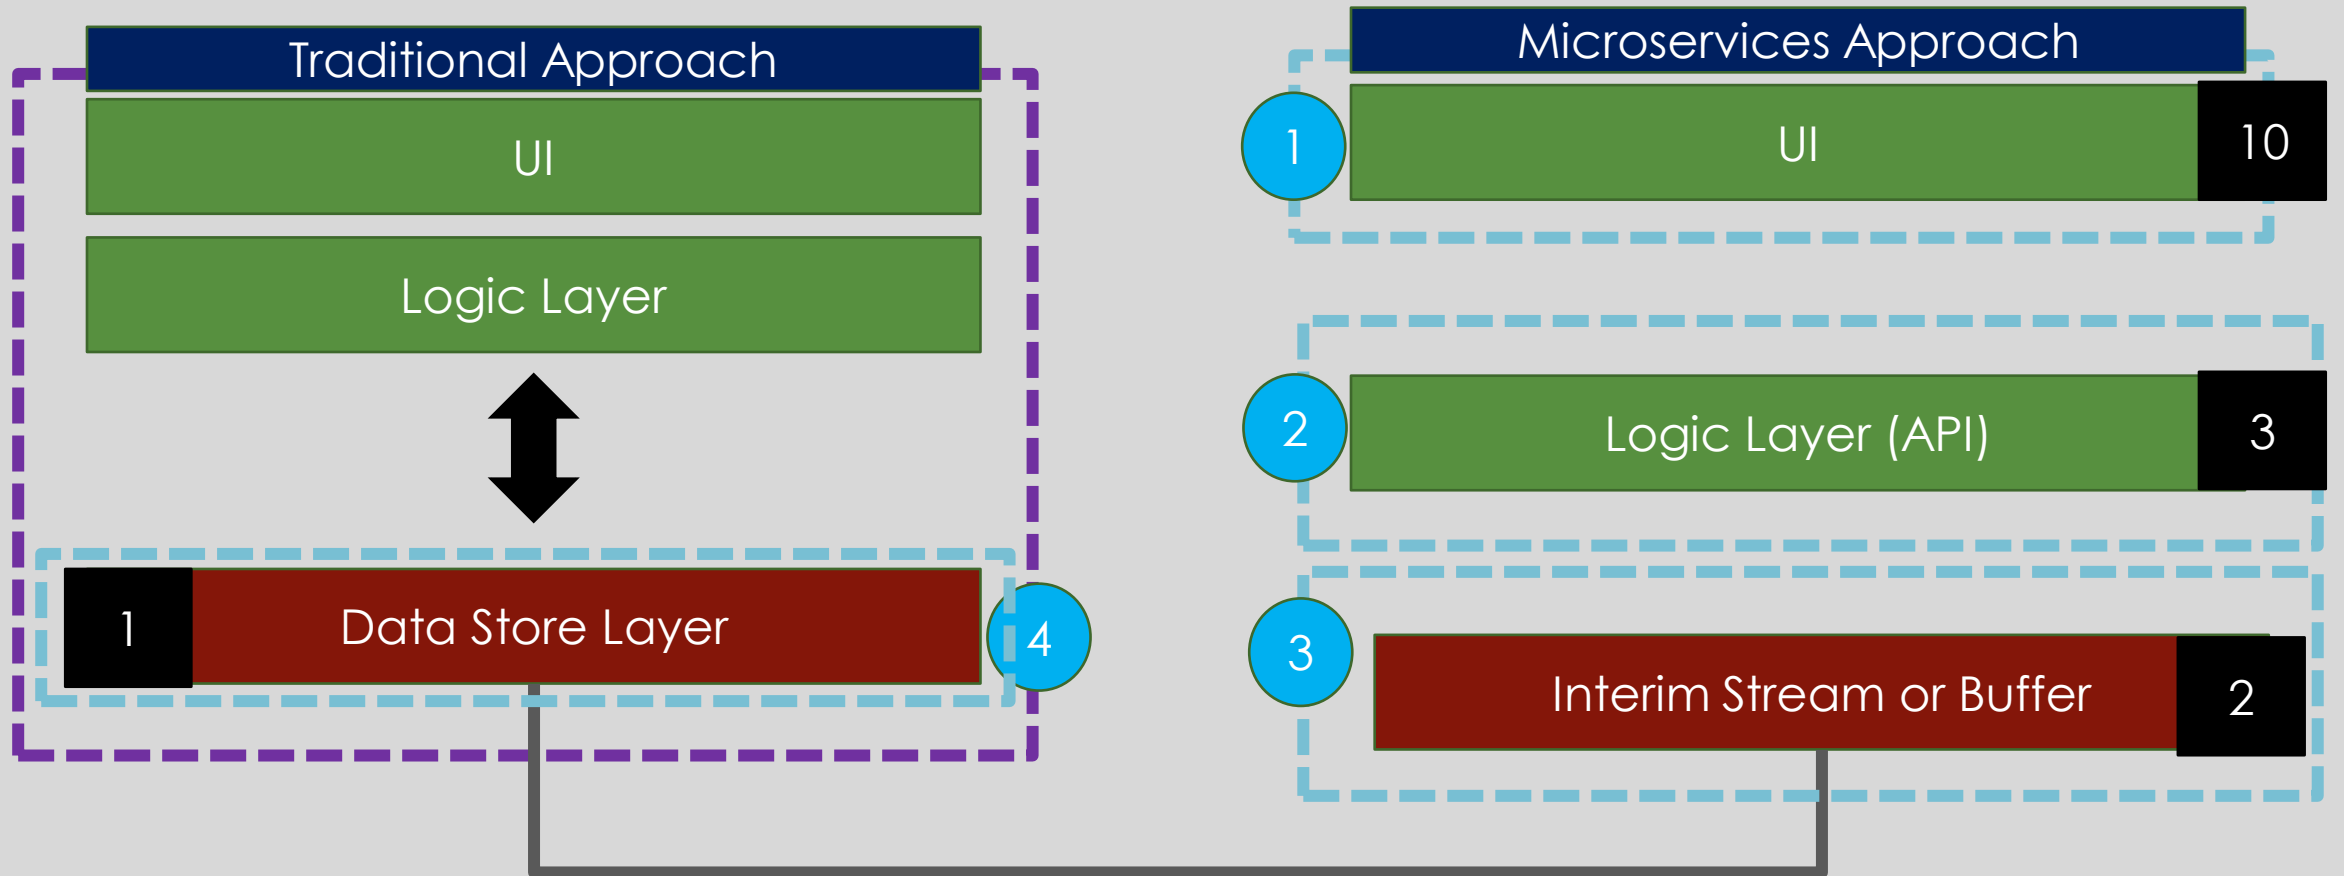

- Treat Dependent Services as Attached Services
- Build, Deploy and Release should be treated in same environment/as separate stages
- Run your Microservice application as Independent Process (Container)
- Port Bindings – Expose/Port Forward/Publish Rest calls
- Concurrency – Scale out as Process model
- Disposability – Start up and Shutdown (Garbage Collectors)

12-app factors

Management Properties

- Collect Data (Logs), Evaluate Metrics , Keep Monitoring (Resilience)
- Administration Console or Configuration Management / Application Management
- Code base versioning → Staging for Builds for Versioning (Rollback on changes)

SDU (Single Deployable Unit)

Comprehensive Framework

Interceptor Services
